COURSE: CODING FOR ECONOMISTS

Final Project Documentation

Author: Kristóf Reizinger

Date: 24th March, 2022

Files

My files

- create_folder_structure.txt
- data_manipulation.py
- data_manipulation_stata.do
- 1_data_preparation.do
- 2_merge_files.do
- 3_for_cycle.do
- 4_regression_plotting.do

Data files

- health2019.csv
- health2019_part1.csv
- health2019_part2.csv

Generated files

- health2019.dta
- health2019_new.dta
- vaccinated.rtf
- vaccinated.txt

Coding design

Folder structure Firstly, I have created the Folder structure to my project using command in create_folder_structure.txt file. I moved the data files into the relevant folders.

Python exercise Considering the Python related exercise, I recommend to navigate to *codes* and *python_codes* folder. You can run the python file in this folder. (All necessary data are available here.) You will need Internet connection, because I use `finance.yahoo.com` to get some financial data, which has dictionary format to demonstrate relevant dictionary related skills. (This is the reason, why the python code data_manipulation.py takes longer time to run.) All functions are defined step by step, you can run the whole file and it will print out the results.

Stata exercise To reproduce the Stata exercise, you should go back to the main folder (*CEU_coding_project*). You can run the do file (*data_manipulation_stata.do*) from this folder. When I read or write data, I have defined relative path. (Versus to the Python part, all paths are absolute. So, you should take it into consideration, when running the code.)

Firstly, I wrote the whole Stata code in one file *data_manipulation_stata.do*, but I have splitted into four parts:

- 1_data_preparation.do
- 2_merge_files.do
- 3_for_cycle.do
- 4_regression_plotting.do

The numbers indicates the order, I recommend you to run the files.
